Boost Your Pasture Potential with

Grass PRO

Grass Pro is a nitrogen and sulphur fertiliser developed to help boost your pasture growth. By applying sulphur alongside nitrogen applications to pasture this winter, growers may see a potential increase of dry matter production of grasses and help reduce feed shortages this winter.

Boost Your Pasture, Hay and Livestock Potential with Grass Pro

Whether to apply sulphur fertiliser or not is a question some pasture growers may currently be considering. Sulphur is an essential nutrient for grass growth and is closely associated with nitrogen uptake and efficiency. So if growers are looking to maximise their returns this season then sulphur may play a role in delivering results.

Why is sulphur important in pasture?

Sulphur is essential for the formation of amino acids, the molecules that form proteins which are needed for growth and development in plants and animals. Sulphur is also essential for nitrogen fixation by legumes.

As grass grows, both sulphur and nitrogen are used together so a sulphur deficiency may decrease nitrogen use efficiency. Thus, sulphur is an important nutrient for grassland and is closely associated with Nitrogen uptake and efficiency (Price, 2006).

Why do pastures need Nitrogen?

Nitrogen is required by plants in a greater quantity than any other nutrient. It is one of the most commonly limiting nutrients in agricultural production systems. Nitrogen is an essential component of amino acids, which form plant proteins. Where the supply of nitrogen from clover becomes inadequate. The grass component may require nitrogen applications to close the nitrogen supply gap and optimise pasture growth.

This autumn, it is essential to promote additional pasture growth for those hoping to build up a winter feed wedge. Grass Pro 3312 may assist growers in supplying required nitrogen to achieve desired growth.

Price, G., 2006. Australian soil fertility manual. 3rd ed. Melbourne: CSIRO Publishing, p.63.

Why choose Grass Pro 3312 this season?

Grass Pro is a nitrogen and sulphur fertiliser developed to help boost your pasture, hay and livestock profitability. By applying sulphur alongside nitrogen applications to pasture this winter, growers may see a potential increase of dry matter production of grasses and help reduce feed shortages over the colder months.
